# EXPERIMENT -11

## Routing at Network layer.

**AIM:**

To simulate static routing and RIP using cisco packet tracer.

**A) Static Routing:**

Static routing is a method where router are manually added to the router routing table.

**Procedure:**

1. Open cisco packet tracker.
2. Place required router, switch and PC in work space.
3. Connect the device using suitable cables.
4. Assign IP address to all PCs and router interface.
5. Open the route, CLI
6. Enter the full command to configure static router.
7. Use full command to check routing table show IP route.

B) RIP Routing:

RIP is a dynamic routing protocol It allows routers to automatically exchange information.

Procedure:

1. Create network with three router and PCs shown in packet tracer topology
2. Assign IP address to PCs and router interface
3. Configure the router interface
4. Enable RIP router
5. Repeat RIP configuration.

Observation:

In static routing router are manually configured by admission.

RESULT: Thus static routing and RIP were successfully simulated using cisco packet tracer.
